Florida Crop and Livestock
Reporting Service
Richard P. Small, Chief

Division of Marketing
John D. Stiles, Director

Cooperating with

U. S. Department of Agriculture
Statistical Reporting Service

Acknowledgment

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida as shown in this summary are official estimates of the Florida Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA, Statistical Reporting Service. Canned and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services, were employed in production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of James W. Todd and Robert R. Terry of the Florida Crop and Livestock Reporting Service.

For information call: (305) 420-6015.

FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS AND MONTHS, 1981-82 CROP YEAR

For the past two successive Januarys–1981 and 1982 –many of Florida's citrus producing areas experienced major freeze damage to both fruit and trees.

The 1981 freeze was reviewed in the previous summary. Comments in this review highlight the 1982 freeze and the weather during the more critical growing and harvest months of November 1981 through March 1982.

A weak cold front moved through the state the week of October 19, bringing thunderstorms and the season's first cool nights. By the first week of November citrus tree foliage was turning darker green, reflecting slower growth due to shorter days and cooler nights. On the 7th and 8th, lows in the 40's were recorded in the central portion of the Peninsula and in the 50's farther south. On the 23rd, a front passed through Florida with low readings the morning of the 24th ranging from the high 30's to low 40's in the citrus belt. Freezing temperatures occurred in the central interior with light frost observed as far south as Lake Okeechobee. Rainfall was adequate during the month and irrigation was limited to a few locations.

Several cold fronts moved through the state during December, the first occurring on the 5th of the month. On the 13th, freezing temperatures and frost were observed as far south as Lake Okeechobee. A very strong arctic front moved south through Florida on the 20th, bringing the coldest temperatures recorded for that day in over 100 years. Readings dipped into the teens in the north to near 20's in the colder locations of the southern portion of the state. The lower East Coast was the only area to escape freezing temperatures. Most of the citrus belt escaped serious freeze damage on the 20th. Coldest readings were in pockets of the southwest interior portion of Hardee, DeSoto, and Charlotte counties. Varying amounts of slush ice were found in oranges in these colder areas. Wind prevented any significant frost formation. Irrigation was prevalent during the month due to the small amount of rainfall.

By early January, young trees in the freeze damaged counties were defoliating. Older trees in the colder locations were dropping some of their outer leaves. Several weeks of warmer than normal weather preceeded a hard freeze that hit all citrus growing areas the morning of January 12th. Most groves experienced temperatures in the 20's with minimums in some colder locations in the citrus belt in the upper teens. Many locations had 8-12 hours below 28 degrees. Ice of varying amounts was found in fruit in most northern and central locations. The majority of the groves in the south central areas had at least some slush ice. In 1981 the lower Indian River producing area escaped freezing weather of any significant duration but in 1982 ice was found in fruit all along the East Coast. On the 23rd and 24th another cold front of much less intensity passed through the state with temperatures averaging five degrees below normal.

Following the January 12th freeze the weather moderated. Many trees in all of producing areas had varying amounts of dehydrated and frozen foliage. The harder hit oranges and Temples were showing an increased amount of fruit droppage.

Although there were several cold fronts that moved through the state in February and March, temperatures were above normal. In early February new growth and bloom buds began to come out. By mid February with the aid of good soil moisture and warm weather new growth and new bloom were abundant. Peak bloom came in early March, several weeks in advance of normal. Near ideal weather conditions for tree recovery continued throughout the spring. Soil moisture, with the aid of supplemental irrigation was sufficient. Summer rainfall was above average in most areas.

1981-82 PRODUCTION SUMMARY

Florida's 1981-82 season began with full bloom by early-to-mid March, two to four weeks earlier than normal. Trees were recovering from the January freeze which had caused extensive defoliation in large areas of the citrus belt. Bloom was variable throughout the citrus belt depending upon extent of cold damage.

The spring weather was dry with most citrus areas receiving only light amounts of rain until late May - early June when summer rain patterns began to develop. A detailed description of winter weather conditions including the January freeze can be found on the preceding page.

In the January freezes of 1977 and 1981, approximately 15 percent of the pre-freeze forecasted boxes were lost. In the January 1982 freeze, about 22 percent (36 million boxes) were lost. Loss occurred from fruit droppage as well as dehydration of fruit. FCOJ yield at 42° Brix averaged 1.2773 gallons per box compared to the previous season's average of 1.2574 at 42° Brix equivalent.

Final orange production at 125,800,000 boxes was 24 percent less than the itital October forecast, and 27 percent less than the 172,400,000 million boxes produced in the previous season. It was also the smallest crop produced since the 1967-78 season when only 100,500,000 boxes were produced.

Grapefruit production at 43,100,000 boxes was about 4 percent less than the previous season's production of 50,300,000 boxes. Production of specialty crops was very close to the previous season's production.

The January 1982 freeze did not kill as many citrus trees as the freezes in 1977 and 1981, possibly because of the near ideal recovery conditions that followed. Defoliation was widespread, with varying amounts of wood loss.

California's orange crop was 43,000,000 boxes, 34 percent less than the previous season's record high production of 65,250,000 boxes. Grapefruit production was 18 percent less than the previous season. Lemon production was also down.

Arizona orange production at 3,050,000 boxes was near previous seasons' production levels. Grapefruit production at 2,400,000 boxes, was the lowest in several seasons.

Texas orange production was 5,940,000 boxes, 37 percent more than the previous season and near earlier seasons production levels. Grapefruit production was a record 13,900,000 boxes, 12 percent greater than the previous high of 12,400,000 boxes for the 1976-77 season.

TREE CENSUS

The Florida Crop and Livestock Reporting Service first began indexing the State's commercial citrus groves on aerial photography as of January, 1966. Ground crews in 4-wheel drive vehicles identify all the State's groves by year in which set, fruit type, and row spacing. Photo interpreters in the Orlando office then delineate the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 660 feet. Variety blocks are measured with planimeters to obtain acreage and then indexed by land section.

The 1966 survey indicated there were 66,441,000 commerical citrus trees on 858,082 net acres of land. In addition, the survey provided acreage and number of trees by county, variety and year set. But, of equal importance, the inventory was designed for quick and economical updating. Since that time, the production area has been resurveyed each second winter - 1968 through 1982 to determine changes.

Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile-wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography is obtained at a 1 to 30,000 scale.

The latest survey shows there were 847,856 acres of commercial citrus in Florida as of 1982. This is a net increase of 0.3 percent from the 845,283 acres in January 1980. New citrus groves set during the calender years of 1980 and 1981 totaled 54,515 acres which more than offset the 51,942 acres lost. Net increases occurred in the East Coast and Lower Interior growing areas.

In addition to enumerating changes in grove acreage, the surveys since 1976 were designed to give greater detail on acreage removals and additions. The 1982 results showed that nearly one half of the newly planted equivalent acres were large plantings on new land. Another 35 percent of the new plantings were resets in existing groves.

Only 10 percent of the lost acreage occurred because of commercial development with 47 percent occurring as vacancies in existing groves. Three major freezes in recent years account for most of the within grove losses.

Florida, all citrus: Acres in commercial groves as of January, 1966 - 1982, with percent changes

Year	Acres	Change from previous survey	Change from 1966 survey
		Percent	
1966	858,082	---	---
1968	931,249	+8.5	+8.5
1970	941,471	+1.1	+9.7
1972	878,019	- 6.7	+2.3
1974	864,098	- 1.6	+ .7
1976	852,369	- 1.4	- .7
1978	831,235	- 2.5	- 3.1
1980	845,283	+1.7	- 1.5
1982	847,856	+ .3	- 1.2

1981-82 VALUE OF SALES, PRICES AND EXPORTS

VALUE

The preliminary on-tree value of all citrus for the 1981-82 crop year is $799,791,000. This is 16 percent less than the 1980-81 revised value of $953,350,000 and 23 percent less than the record high 1979-80 season total of $1,037,050,000.

Preliminary value is based on that part of crop that was priced at harvest, about 30 percent of the total. When all participation plans and cooperative prices are finalized, a revised value will be calculated.

The 1981-82 season average on-tree price of oranges was $4.84 per box, an increase of 80 cents over the revised 1980-81 average of $4.04. Preliminary grapefruit prices fell to $2.42 per box from the previous season's $3.60. Price received for processing grapefruit at $1.33 per box, was less than half of the previous season's $2.76 per box.

During the 1981-82 season the delivered-in price for all priced fruit going into FCOJ was $1.20 per pound of solids, 21 percent more than last season's $0.99.

Florida, all citrus: Value of sales on-tree, crop years 1972-73 through 1981-82

Crop year	Value 1,000 dollars	Crop year	Value 1,000 dollars
1972-73	$394,645	1977-78	$ 848,680
1973-74	359,388	1978-79	966,916
1974-75	397,066	1979-80	1,037,050
1975-76	440,326	1980-81 1/	953,350
1976-77	529,765	1981-82 2/	799,791

1/ Revised. 2/ Preliminary.

COUNTY PRODUCTION

Estimates of ctirus production by counties were prepared from objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for droppage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Data on production is obtained from several objective fruit surveys: limb count and size and droppage samples. Because of the statistical sampling design, counties with higher production in general have a greater number of fruit samples, and therefore estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are still more reliable.

PRICES

All on-tree prices reported by the U. S. Department of Agriculture's Statistical Reporting Service and the Florida Crop and Livestock Reporting Service represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Each season, beginning with the first month that three percent of a fruit type is harvested, the Florida Crop and Livestock Reporting Service estimates an average monthly price. Fresh fruit sales organizations provide the average F.O.B. price and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales for each month. At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, a survey of cooperatives and firms with market participation plans is conducted to establish a value of fruit previously classed as non-priced fruit. These prices, combined with spot and cash prices collected earlier, are weighted together to determine the final processing price received by growers for various varieties of citrus. Charges for picking, hauling and packing, as determined by University of Florida economists, are deducted from the weighted average of prices obtained from all segments of the citrus industry to arrive at the final on-tree price received by growers.

FOREIGN EXPORTS

Fresh exports of citrus to countries other than Canada and Mexico for the 1981-82 season were 10,144,000 cartons, slightly less than the previous season's total of 10,589,000 cartons. This is the lowest amount shipped in four seasons.

Grapefruit exports accounted for 98 percent of total citrus exports, with Japan the principal receiver. Over 68 percent of the total grapefruit exports were to Japan with the second largest receiver, France taking only 20 percent.

Orange exports decreased slightly from the previous season but were near the last four seasons' levels. Puerto Rico received the largest amount of orange exports, over 80 percent of the total shipped from Florida. Japan and Germany also took some supplies of oranges.

Tangerine exports amounted to 32,000 cartons, all shipped to Puerto Rico. The January, 1982 freeze curtailed exports of any other specialty crops.

Frozen concentrated orange juice (FCOJ) is Florida's major processed product sold in export markets. Florida exported 11.7 million 43.4° Brix gallons of FCOJ in the 1980-81 season. Exports in the 1981-82 season are expected to be down from the previous season. Canada is the major FCOJ export market for the U. S. Increasing Brazilian production and expansion of their export market limits market expansion opportunities for Florida.

Citrus box weights: Approximate net weight in pounds by fruit type and States

States	Oranges and others 1/	Grape-fruit	Tange-rines	Lemons	Limes
Florida	90	85	95	90	80
California	75	65	75	76	--

History of Florida's Citrus Industry

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were grown in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the state. One of the oldest, cultivated groves planted in Florida (Hume, 1926 p. 95) is thought to be the Don Phillipe grove in Pinellas County, planted some time between 1809 and 1820.

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased. As the decade of the seventies began, Florida's dominance of the Nation's citrus became even more apparent. In 1981-82, Florida had 68.1 percent of the Nation's production.

Footnote 2/ for page 32, 1/ for pages 33 and 34. Final Mexican shipments to the U. S. are reported by FAS as a combined total for oranges and tangerines. The total shown on pages 32 through 34 has been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases gave separate totals for these two types of citrus. Mexican shipments exclude Canadian shipments.

ACKNOWLEDGMENT

The acreage, production and value statistics in this bulletin are official state and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida, Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; Charles Robertson, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production and price statistics in this bulletin. This report was assembled under the direction of Ed C. James, Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service and E. F. Scarborough, Bureau of Market News. The authors also wish to thank Becky Altman, Jackie Bowen, Marilyn Clark, Diana Clingan, Ray Crickenberger, Linda Fisher, Joe Galant, Kitty Hildreth, Barbara Palmer, Tommy Scherer, Pat Todd and others of the Florida Crop and Livestock Reporting Service who assisted in compiling and preparing this report.

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS–During the growing season, estimates were prepared for most crops on a six month seasonal group basis. The periods are for the crop year July-December and January through June. The two six month periods were combined in this publication into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during the crop year. Acreage lost and replanted to the same crop in time for harvest in the same quarter is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the state.

All shipments and unloads, rail, truck, air and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT–The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question is revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT

Most common unit,estimated net weight, number of units per hundredweight, principal vegetable commodities, Florida, 1980-81 crop season

Commodity	Unit	Est. net weight	No. of units per cwt.	Commodity	Unit	Est. Net weight	No. of units per cwt.
		Pounds				Pounds

Escarole	Crate	25	4.000	Watermelons	Cwt.	100	---

SUMMARY OF THE 1981-82 VEGETABLE SEASON

The farm value of Florida grown vegetables, melons, potatoes and strawberries sold in the 1981-82 crop year totaled $927.4 million, up $64.6 million from the 1980-81 crop year. Acreage harvested was 3 percent below the previous year. Crops showing the greatest declines in harvested acres were cabbage, sweet corn, lettuce, radishes and tomatoes. Crops with the largest gains in harvested acres were snap beans, squash and strawberries. Crops increasing in value were snap beans, cabbage, sweet corn, eggplant, escarole, lettuce, radishes, squash, tomatoes, watermelons and strawberries. Crops with lower total values than the previous year were carrots, celery, cucumbers, green peppers and potatoes. Except for strawberries, most of the increases in value were due to higher season average prices. Strawberries, which rose $24.5 million as a result of gains in production and prices showed the greatest increase in value. Next was lettuce which increased $20.8 million, tomatoes, $9.7 million, and sweet corn, $6.9 million from a year ago. Potatoes and green peppers showed the greatest declines, down $12.6 million and $8.9 million, respectively, from the previous year.

Average yields for cucumbers, eggplant, escarole, potatoes, squash and tomatoes increased over the previous year but yields declined for snap beans, cabbage, carrots, celery, sweet corn, lettuce, green peppers, radishes and strawberries.

Season average prices for cabbage, carrots, celery, sweet corn, eggplant, escarole, lettuce, radishes, watermelons and strawberries were higher than a year ago. Prices for snap beans, cucumbers, green peppers, potatoes, and tomatoes were lower than the previous year. Squash prices were unchanged.

Land preparation was active in most areas of the state during July but generally hot, dry weather limited plantings. Growing conditions in August were mostly good except for heavy rains late in the month. Plantings were on schedule except in Dade County where tropical storm Dennis caused heavy flooding. Rainfall was variable in September and October with heavier amounts along the lower East Coast. Irrigation became steady in the drier localities during October. Wet and windy weather in early November interrupted harvesting and planting, particularly in the lower East Coast area.

Weather in December was adverse as a series of cold fronts moved over the state. On December 11, freezing temperatures and frost extended southward to Lake Okeechobee. Record breaking low temperatures occurred on the 19th and 20th when an arctic air mass with frigid strong winds invaded the state. Temperatures dipped to near 20 degrees in spots of south Florida. Damage to some tender crops was heavy in the Immokalee-Everglades area. The remainder of December was mostly mild.

Cold fronts were numerous in January but the only severe freeze occurred on the 12th. Temperatures fell into the 20's in the vegetable areas. Some acreage was lost and damage was moderate to heavy, particularly to older plants. A brief warming trend with rain was followed by another cold front with light to moderate frost after mid month. Mild to cool temperatures with scattered showers prevailed for the rest of the month.

February was generally mild with mostly normal to above normal temperatures in the winter vegetable areas. Rainfall was variable except for some general rains about midmonth. Irrigation was very active in the drier localities.

Temperatures in March were mostly above normal with periods of unseasonably warm weather. Statewide rains of significant amounts with reports of large hail in central Florida occurred in early March. Midmonth was fair and dry. A cold front that stalled over south Florida in late March brought 2 to 4 inches of rain to most areas. Flooding occurred in Palm Beach County which had up to 10 inches of rain.

Early April was a period of showers, locally severe thunderstorms and strong winds. Plant damage was variable. Some serious flooding occurred in the north central area. Hail and high winds caused heavy damage in the Sanford area. Mid April was mostly hot and dry. More rain fell in late April with heaviest amounts along the lower East Coast. Harvest was in full swing for some crops while others were declining seasonally.

Much of May was fair and dry with normal to below normal temperatures. Irrigation was very active. Tropical air combined with upper air disturbances produced widespread and above normal shower and thunderstorm activity for late May. Cumulative rainfall for the year was above normal for most stations. Harvest was very active for some vegetables but declining for others.

Hot days and warm nights dominated the weather picture during June in the vegetable areas. Humid tropical air produced above normal shower and thunderstorm activity in early June. Heavier amounts fell in south Florida as Hurricane Alberto approached the coast before dissipating. The following week was mostly hot and dry. The remainder of June was wet with frequent thunderstorms and above normal rains almost statewide. Harvest was essentially complete for most crops in the major vegetable areas by the end of June.

Most of the weather data for this summary was supplied through the National Weather Service, U. S. Department of Commerce, Ruskin, Florida. Information on the effects of weather on crops was provided by the Florida Crop and Livestock Reporting Service fieldmen.

SNAP BEANS
1981-82

Florida growers produced 4.0 million bushels of bush and pole beans during the 1981-82 season for fresh and processing utilization, up 9 percent from a year earlier. Acreage harvested for fresh and processing totaled 48,300 acres, up 13 percent from the 42,600 acres harvested during the previous season. The freeze in January resulted in some lost acreage. The average yield for the 1981-82 season was 82 bushels per acre for fresh market and 100 bushels per acre for processing, as compared with 85 bushels and 133 bushels, respectively, for the previous year.

The average f.o.b. price of $10.33 per bushel for fresh market was 6 cents less than the previous year. Prices were high in January and February because supplies were reduced by the January freeze. At $3.00 per bushel, snap beans for processing were down 45 cents from last season. Total value, at $39.7 million, was 8 percent above last year.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are grown primarily in Dade County, with small acreages in Gadsden and Marion counties and the west central area.

Earliest fall supplies of snap beans originate from west Florida. The northern and west central areas, the Everglades and southeastern districts also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

Snap bean production extended from late September into mid June. The fall crop peaked in December. Marketings declined in January and February but less than last year. Production for the season peaked in March. Normally, April is the month of peak production. About 19 percent of the fresh marketings occurred in March.

Variable weather influenced the bean crop. Locally heavy rains in the fall delayed plantings or necessitated reseeding in some areas. Cold weather in December slowed growth. The January freeze resulted in variable plant damage and some lost acreage. The remainder of the winter was generally mild. Heavy rains during March and April hurt the crop in the Pompano area. Hail damage and disease problems also contributed to lower production. Spring weather was generally favorable. Quality was mostly good but yields were variable.

CABBAGE
1981-82

Florida growers produced 5.8 million crates and bags of cabbage during the 1981-82 season. Production at this level is 20 percent less than the previous year and the lowest since the 1969-70 season when 5.5 million crates were produced. The gross value was $33.6 million, a 24 percent increase over the previous year's total of $27.1 million. The average f.o.b. price was $5.75 per crate or bag, up $2.02 from the $3.73 received for the prior season's crop. The higher average price received accounted for the sharp increase in value.

Total plantings were 16,500 acres, down 6 percent from the 17,600 planted during the 1980-81 season. A total of 14,200 acres were harvested. The average yield of 411 crates or bags per acre was down by 48 bags from the previous season's average.

Cabbage was available for market in late October and continued through June. Production during the fall months was down from the previous fall. The peak month was April followed by March and January.

The Hastings area, which includes the three counties of Flagler, Putnam and St. Johns, is the leading producing area in the state. This area accounted for 65 percent of the state's production during the 1981-82 season. The leading cabbage producing County is St. Johns with 4,700 acres harvested, or 33 percent of the state's total.

Planting got underway in late August and early September. The most active period was October through December. Transplanting is the main method of planting cabbage. Some seed is planted directly into fields but this method accounts for a very small portion of the total acreage planted.

Harvest began in late October, increasing slowly into December and then picked up sharply in January. A hard freeze near mid January damaged the cabbage crop and production dropped off sharply in February. Harvest increased in March and peaked during April. Winter production accounted for nearly 52 percent of the total production, the spring months accounted for 39 percent and fall months 9 percent.

CARROTS
1981-82

Production of carrots in Florida for fresh market and processing utilization during the 1981-82 season totaled 921,000 cwt., down 33 percent from the previous season. Fresh use constituted 80 percent and processing 20 percent. This compares with 78 percent fresh and 22 percent processing the previous year. Approximately 21 percent of the fresh carrots were mini or finger carrots compared with 16 percent a year earlier. The remaining 79 percent were the regular type carrots.

There were 9,400 acres harvested from the 10,500 acres planted during the 1981-82 crop year. This compares with 10,500 acres harvested from 11,000 acres planted a year earlier. The severe freeze of January 1982 resulted in some lost acreage, particularly of young carrots, and plant damage. Effects of the freeze, some disease problems, and heavy gradeout at times lowered yield and production. Average price received for the 1981-82 crop was $14.30 per cwt. compared with $12.30 per cwt. the previous year. Total value was $13.2 million, down 22 percent from the record $16.8 million for the 1980-81 crop.

The muck soils around Lake Apopka, near Zellwood, and in the Everglades area south of Lake Okeechobee provide a good medium for growth. By far the majority of carrots are grown in the Zellwood area. The mini or finger carrot movement usually begins in late October or early November and ends by late May. Regular size carrots are harvested from November through June. Young carrots are subject to cold damage during January and February in the Zellwood area. Size and quality were mostly good during the 1981-82 crop year.

CELERY
1981-82

Florida celery marketings of 5.1 million crates were harvested from 9,500 acres during the 1981-82 growing season. The average yield of 537 crates per acre compares with 605 crates the previous year.

Prices averaged slightly higher than the previous year and at $7.58 per crate, compared with $7.09 per crate during the 1980-81 crop season. Prices during February, March and April averaged higher than the same months the previous year while prices during November through January and May and June averaged lower than the previous year.

The Everglades, with 83 percent of the harvested acreage in the state, was the foremost area of production throughout the season. The north central area supplemented by a light supply from the Sarasota area, accounted for the remaining 17 percent of acreage and provided continuous supplies during the season.

Plant bed preparation and seeding were underway by mid June. Transplanting got underway in August and became active in September. Wet soils in August and early September delayed harvest. Transplantings for the season in the Everglades ended in early April. Transplantings in the central area ended in May. Growers in the Sarasota area normally planted from October to March.

Light harvest began in the central area in early November, and at mid November in the Everglades. Freezing temperatures on January 12 caused some problems in celery and some seeders developed later. After the January freeze, growing conditions were generally favorable. Spraying for leaf miners was active in the fall and spring. Celery quality was generally good to excellent during most of the winter and spring harvest periods. A limited amount of acres were passed during the spring. Overall yields were about 11 percent below a year earlier and were well below recent years. The heavy drop in yields occurred in the Everglades since yields were higher in the central area. Some of the reduced yields resulted from the January freeze and development of seeders. Prices were generally favorable during the midwinter months but low in April and May. Approximately 7 percent of the crop was not harvested for various reasons. This compares with 9 percent not harvested the previous year. Some acreage was passed in order to maintain good quality celery.

Celery cutting was most active December through May with peak production coming during April and May. Cutting was completed in all areas by mid July.

Celery is subject to a federal marketing order administered by the Florida Celery Committee. Field supervisors provided the basic acreage and production data. In cooperation with the Celery Committee, these data are assembled into weekly, monthly and annual reports and published in this Annual Summary.

CHINESE CABBAGE
1981-82

Chinese cabbage is grown primarily on the mucklands of the Zellwood and Everglades areas. The organic soils provide a very good medium for rapid growth. Harvest was underway by late November and reached a good volume in December. Volume declined in January because of the severe freeze and then steadily increased until it peaked in April. Good supplies were available into May. During April and May, Zellwood was providing good supplies while the Everglades were winding down for the season. Light supplies were available into June. Quality was generally good during most of the growing season. Shipments for the 1981-82 season totaled 100,000 cwt. compared with 137,000 cwt. a year earlier.

SWEET CORN
1981-82

Florida continued as the Nation's leader in sweet corn production for fresh market. During the 1981-82 marketing year, Florida produced 10.8 million crates of corn. This is 4 percent less than production a year earlier. The decline was due primarily to fewer acres. Part of the reduced harvested acreage was due to the severe freeze on January 12, 1982 that destroyed considerable acreage of older corn near the harvest stage in the Pompano area. Harvested acres totaled 50,100 compared with 51,900 harvested the previous year. Yields averaged 215 crates per acre, down two crates from the previous crop year.

The season average f.o.b. price of $5.68 per crate was 86 cents more than the $4.82 per crate average in the 1980-81 crop season. Sweet corn ranked second in value of vegetables produced in the state and was exceeded in value only by tomatoes.

First plantings of the season were underway in the Everglades and Zellwood areas in July. Seeding along the southeast coast got underway in early October. First harvest began in the Zellwood area after mid September. The crop in the Everglades was slowed by heavy rains. Harvest got underway by mid October. Harvest ended in December when freezing temperatures entered the area on December 20. Some acreage was lost. Harvest then shifted to the East Coast and later Dade County. Pulling of commercial acreage in Dade County started around February 1 and reached good volume by late March. The mid January freeze damaged the Pompano crop and harvest was light for several weeks. Early spring planted fields in the Everglades were damaged and some replanting was necessary.

Harvest of the important spring crop got underway in early April in the Everglades area and provided the main supply until the Zellwood area came into production in late April and early May. The Zellwood area was the main source of supply during June and July. The season ended around mid July.

A small acreage continued to provide supplemental supplies from Zellwood and the west central area during the early fall and from Sarasota in the early spring.

Weather during the growing season was marked by heavy rains in the fall and freezes during December and January. Yields were reduced somewhat by the adverse conditions. Growing conditions after the January freeze were generally favorable. Quality and ear size improved as the season progressed into late winter and early spring.

CUCUMBERS
1981-82

Florida's production of cucumbers for fresh market during the 1981-82 crop year was 4.7 million bushels, up about 16 percent from the 1980-81 crop. The 16,100 acres planted for fresh market was up 300 acres from the previous year. Fresh market harvested acres totaled 15,300, an increase of 400 acres from a year earlier. Average yield per acre for fresh market, at 308 bushels, was up 35 bushels from the previous season. Total fresh market production was valued at $33.0 million compared with $36.1 million for the 1980-81 season. The fresh market price for 1981-82 averaged $7.00 per bushel compared with $8.85 the previous year.

Supplies in 1981-82 were generally available from October through June, with light marketings during the winter months and June. Many of the recorded shipments moving out-of-state January through March are from offshore and truck imports resold in mixed loads.

The production of cucumbers is well distributed across the state. The southwest area, with 43 percent of the planted acreage in 1981-82, is the largest area. The west central area accounted for 30 percent of the acreage in the state. The west, north, north central, and the southeast areas provide the remaining acreage.

The crop was mostly in good condition during the fall. Record breaking cold temperatures December 19-20 essentially destroyed the crop in the Immokalee area and caused damage in other areas. A hard freeze on January 12 killed new plants above ground in the Immokalee area and caused heavy damage in other areas. Planting and replanting were very active. Remaining winter weather was generally mild and volume rebounded in March. Spring was warmer than normal; and irrigation was very active during the dry periods. Fruit quality, color, and size were mostly good during the spring season but yields were variable.

EGGPLANT
1981-82

Plantings totaled 2,640 acres, down 15 percent from the 1980-81 season. Yields averaged 657 bushels per acre compared with 592 bushels for the previous season. Weather was generally favorable during much of the fall, and crop progress was good. Strong winds in late October and November whipped plants and scarred fruit. Freezes in December caused heavy bloom loss but little plant damage. A hard freeze in January resulted in moderate to severe plant damage but only light acreage loss. Generally mild weather in February was favorable for plant recovery but production was light because of earlier bloom damage. Crop condition was generally good to very good during the spring season. Fruit quality, color, size, and yields were mostly good.

Production of eggplant, at 1,661,000 bushels, was slightly above last year's production. Total sales increased to $9.6 million compared with $9.4 million a year earlier. The increase was due to a higher price per bushel because higher yields offset lower harvested acres so that production was about unchanged compared with 1980-81. The season average price of $5.76 per bushel is 9 cents higher than a year ago. Compared with a year earlier, prices for most months were higher in the fall and spring but lower in the winter.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November, and dropped during the winter, particularly in February. Harvest increased rapidly in March and reached a peak in May. Peak harvest was a month earlier than usual because generally mild weather after the January freeze and above normal temperatures during the spring resulted in an early maturing crop. Harvest was essentially complete in early July. The southeastern area around Pompano accounted for 52 percent of the harvested acreage. The northern and central areas combined contributed about 38 percent of the acreage harvested with the remaining acreage in the southwest.

Production is generally continuous throughout the entire crop year in the southeast and southwest. The crops in the western, northern, and central areas are for fall and spring harvest only because these areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern areas in late September. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in the southern areas, and then moved back northward in the spring.

ESCAROLE-ENDIVE
1981-82

Production of escarole and endive during the 1981-82 season totaled 2.7 million crates, down 7 percent from a year earlier. The 5,300 acres harvested were down 15 percent from the previous year. Several large growers discontinued raising escarole and quit farming completely. Yield per acre averaged 512 crates compared with 470 crates the previous year.

Prices during the season averaged $6.65 per crate compared with $3.91 a year earlier. Prices were higher than a year earlier in every month of marketings. Prices were very favorable during the December through February period. Total value of sales, at $18.0 million, was 58 percent more than for the previous season and was the highest of record. The Everglades, which had 67 percent of the harvested acreage, began seeding in late August and early September. Weekly plantings continued through March. Light harvest began in late October and early November and was continuous into early June. The mucklands around Zellwood provided good volume in the late spring months. The small acreage grown around the Lake Placid and Sarasota muck soils furnished supplemental supplies during much of the season.

Sales started slowly in late October and increased to good volume by mid November. Marketings reached peak levels in February, March and April. Sales were complete for the season by early June.

Rains slowed plantings during the fall and the January freeze slowed growth and burned outer portions of plants. Growing conditions for the remaining period were generally favorable. Quality of escarole was mostly good during the season.

LETTUCE
1981-82

Florida lettuce growers produced 2.3 million cwt. during the 1981-82 season, down 16 percent from the previous year. A 13 percent drop in acreage harvested and a slight decline in yields resulted in the decline in production. The average yield per acre was 183 cwt. compared with 188 cwt. for the previous year. Growers harvested 12,300 acres compared with 14,200 acres the previous year. The season average f.o.b. price of $25.16 per cwt. was well above the $13.39 per cwt. received the previous year. Total value reached a record $56.6 million for the season. Prices averaged above a year earlier for every month of the season.

Acreage, production and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance include iceberg, romaine, Boston, bibb and leaf.

The Everglades muckland accounted for 86 percent of the planted acreage and was the source of a continuous supply of good quality lettuce which began in late October and early November and continued through May. Outside the Everglades, Zellwood is the other major producing area, with Sarasota and the Lake Placid mucksoils contributing light supplies during most of the season.

Seeding was underway in late August and early September. All areas were actively planting by mid October. The Everglades and Sarasota areas had continuous plantings through March.

Very light harvest of specialty types was underway in late October and harvest continued light until late November. Volume gained significantly in December and continued heavy until early May. Harvest of the iceberg type began in late November. Most iceberg lettuce is planted in the Everglades. Harvest was completed for all types by late May. Volume from the Zellwood area was light during the winter months. Moderate supplies are available from this area during the fall and spring months.

Growing conditions in the fall were hot, humid and wet. Frequent showers interrupted planting and slowed field work. Several cold fronts slowed growth and caused some damage to outer leaves. After the January freeze, growing conditions were mostly favorable. Heavy volume was available during March and April. Quality was generally good throughout the growing season.

PEPPERS
1981-82

Florida produced 7.9 million bushels of peppers during the 1981-82 season, slightly below the previous year. The average yield of 412 bushels per acre was 5 percent below the 435 bushels per acre last season. Harvested acreage, at 19,300 acres, was 5 percent more than the 18,300 acres harvested in 1980-81.

The season average f.o.b. price of $7.00 per bushel was down from an average of $8.10 for the previous season. The total value of $55.6 million was 14 percent below the previous year. Prices were generally below last year except for May and June. Prices in February and March were well below last year because adverse weather had much less effect on production than a year ago. Peak spring production occurred in April. The season then declined and was mostly over by the end of June.

Total planted acreage increased 5 percent over the previous season. Increases in acreage for the north, west central and southeast areas were partially offset by decreases for the north central and southwest areas. The important southwest area accounted for 41.4 percent of the state's total pepper acreage. The southeast had 32.1 percent; the north area, 9.3 percent; the north central area, 8.8 percent; and the west central area, 8.4 percent.

Hot weather and damp-off necessitated spot replanting to improve stands during November. Conditions during the rest of the fall were generally favorable. The hard freeze in January caused variable damage. Older plantings had the heaviest damage. Replanting, cutting back and planting were active after the freeze. Spring weather was mostly favorable except for heavy rains in the Pompano area. Yields were fair to good.

POTATOES
1981-82

Potato production in Florida in 1982, including both winter and spring, totaled 6.7 million cwt., up nearly 3 percent from the 1981 crop. A total of 30,800 acres were planted in 1982, about 1 percent more than the year before. Of the total acreage planted, 29,900 acres were harvested, the same as 1981. The value of the crop was placed at $60.4 million, down 17 percent from the previous year. The decline in the value of the crop was due to a sharp drop in the average price received. The price received for all potatoes averaged $8.95 per cwt. compared to $11.10 in 1981.

The average yield was 226 cwt. per acre, a new record for Florida, exceeding the previous record by 6 cwt. In the three county Hastings area (Flagler, Putman and St. Johns) the average yield was 240 cwt., down slightly from 1981. Spring potatoes grown in other areas of the state had an average yield of 210 cwt., down 30 cwt. from the year before. However, the average yield for the winter crop was 185 cwt., up sharply from the previous winter of 155 cwt. and was responsible for pushing the all potato yield to the record level.

In south Florida where the winter crop is grown the red skin types are the dominant variety. Most of the winter production is sold for table stock. In the Hastings area the white skin varieties are the most important. Most of this production is used in the potato chip industry. However, potatoes used for table stock are increasing in importance.

Harvest of the winter crop got underway in late January and progressed slowly through most of March. Winter harvest was very active in late March and all of April. Digging of the spring crop was underway in late April and was very active during May. Harvest was completed in June. Acreage abandonment was about normal, caused mostly from flooding of low areas and freezing temperatures in January.

SPINACH FOR PROCESSING
1981-82

Spinach statistics have not been published separately for Florida in recent years to avoid disclosure of individual operations. However, data for these seasons have been included in the "Other Vegetables" series shown in this publication. Data for 1973 and earlier are available upon request. Yields per harvested acre averaged about the same as a year earlier. Most of the crop is grown in the north central areas. The severe freeze in January caused a few problems.

SQUASH
1981-82

Florida's production of squash during the 1981-82 season, at 2.8 million bushels, was 18 percent above last year. The total of 16,600 acres harvested increased 12 percent from the previous year. The yield, at 168 bushels per acre, was up 9 bushels from last year.

The season average price of $9.69 per bushel was down 3 cents from the 1980-81 season. Total cash receipts amounted to $27.0 million. Monthly prices were generally above last year except during the winter months.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. Dade County, with 27 percent of the state's harvested acreage in 1981-82, produces yellow crookneck squash almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the state. This is especially true when local supplies reach low levels during the winter months. The southwest area produces a continuous supply of most types. Central, north, and west Florida provide a good volume of most types during the fall and spring season.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are light and mostly confined to local markets. Conditions were generally favorable during the fall, and marketings reached a fall peak in December. Record breaking cold temperatures in December killed nearly all plants above ground in the southwest area and damaged plants in other areas. An arctic front in January resulted in lost acreage of older plants and moderate to severe damage in younger plants. Replanting was heavy. Generally mild weather was favorable to plant recovery but reduced stands in freeze damaged fields lowered yields. Spring weather was generally favorable but heavy rains and disease problems lowered yields in the Pompano area. Peak marketings for the season occurred in April. The season was essentially complete by the end of June.

RADISHES
1981-82

In the 1981-82 crop year, radish plantings amounted to 27,700 acres compared with 32,900 acres planted during the previous year. Acres harvested totaled 24,500, 16 percent below the 1980-81 season. Yield per acre averaged 240 cartons compared with 247 cartons a year earlier. The crop was valued at a record $23.8 million, up $3.9 million from the previous year and 3 percent more than the previous record value in 1979-80. The average f.o.b. price was $4.05 per carton, up $1.26 from the 1980-81 season. Most monthly prices were above the corresponding prices a year earlier.

Good supplies of both red and white radishes were available from Zellwood, Lake Placid, and the Everglades from October through May with a light volume going into June. The peak fall harvest occurred in December. The spring peak occurred in May. Seeding of the 1981-82 crop was underway in the Everglades and the north central areas in early September. Light harvest was underway in early October. In November, considerable acreage was lost to locally heavy rains in the Everglades. Freezes in December and a severe freeze in January resulted in some crop damage. Supplemental supplies were available from Lake Placid and Sarasota during the year.

STRAWBERRIES
1981-82

Florida strawberry growers produced 8.1 million flats of berries during the 1981-82 season, up 45 percent from the previous year. Harvested acreage totaling 5,000 acres increased 56 percent from the previous year. Yields per acre averaged 1,625 flats compared with 1,750 flats the previous year. While yields were lower than the previous year, they have increased dramatically in recent years. High yielding and early maturing varieties have been introduced in the Hillsborough-Manatee area in recent years. The f.o.b. return per flat for the season was $6.44, an increase of $1.46 per flat over the previous season. The value of the crop was $52.4 million, nearly double the $27.9 million received for the 1980-81 season.

Laying of plastic and other field work was in full swing by late September and transplanting was very active by early October in the important Hillsborough-Manatee area. Transplanting was complete by early November. Plants made good growth and a few blooms were showing by mid November. Light harvest got underway by mid December. Shipments reached a good volume in January and peaked in mid March. The January freeze caused some bloom loss and slowed growth somewhat. Most growers used sprinklers for icing over plants for protection against the freezing temperatures. Gradeout was heavier than normal after the freeze but quality and harvest improved by mid February. Market prices in January and February were below a year earlier while prices in March and April were higher. Growers opened most fields to U-Pic operations in mid-to-late March or early April. Quality and berry size were generally good during the season. U-Pic harvest continued into May. Harvest was underway in Bradford County in mid March. Quality was generally good. The harvest was virtually complete in early May. Most of the acreage in Dade County was for U-Pic and roadside stands.

TOMATOES
1981-82

The total value of the Florida tomato crop for fresh market and processing was $266.3 million–up nearly 4 percent from the previous season. This was a record value for the state. The average price received for fresh tomatoes was $5.23 per 25-pound carton, 26 cents less than the previous season.

Total production of 52.4 million 25-pound carton equivalents was 8 percent above last season and was the reason for the record crop value. Tomatoes utilized for the fresh market amounted to nearly 97 percent of the total while the remaining 3 percent went to processors. The processing segment is a secondary utilization, usually following the fresh market harvest. The Palmetto-Ruskin area accounted for 41.2 percent of the total production and Dade County 26.0 percent. The southwest which was hurt seriously by the January freeze, accounted for 23.5 percent of the total, the Ft. Pierce-Pompano area 6.2 percent and the remaining 3.1 percent was produced in the north, north central and western areas of the state.

The average yield for the state was 1,250 (25-pound) cartons, up 247 cartons from the 1980-81 season. Demand for Florida tomatoes was good during most of the season. Winter production was near normal even though the southwest suffered losses from a hard freeze in January. Dade County which leads in winter production had no major damage from the freeze. Fall production was down from the year before. January was the peak month during the winter period accounting for 12.6 percent of the total production. February production was down, reflecting the damage caused by the freeze. The spring production peaked in May, which accounted for 26.6 percent of the entire season's total. Tomatoes are harvested from late October through early July.

The Palmetto-Ruskin area continued as the acreage leader with 14,900 acres harvested. Dade County continued in second place, harvesting 10,900 acres followed very closely by the southwest which harvested 10,800 acres. The southwest had some acreage lost due to the freeze. There were 2,500 acres harvested in the Ft. Pierce-Pompano area. Gadsden County accounted for the largest portion of the remaining acreage.

Tomato planting got underway in July except Dade County which did not get started until the first week of September. Planting made good progress during the fall as weather was mostly favorable until cold weather around mid December caused some problems. In January another freeze caused damage to tomatoes, mostly in the southwest. The other areas were spared any serious damage. The tomato crops were in good condition by the spring months and production was back to normal. Harvest was complete by early June in the southern-most areas but light harvest continued through June into early July in the other areas.

WATERMELONS
1981-82

Total plantings of watermelons during the 1981-82 season amounted to 56,000 acres, up 4 percent from the previous season. Of the total planted, 48,000 acres were harvested, down 2 percent from the year before. Abandonment was slightly higher than usual due to mostly weather related problems. Production was placed at 7.9 million cwt., down 2 percent from the 1980-81 season. The average yield for the state was 165 cwt. per acre. The area yields were rather variable ranging from 150 cwt. in the north to 210 cwt. in the south.

The average price was a record $6.90 per cwt., up 38 cents from the previous season. Prices received by growers for melons were highest in the south and west central where the harvest begins early. The total value of the crop was a record $54.6 million, up nearly 4 percent from the 1980-81 season.

The watermelon harvest got underway in late April for the first time in five years. The average price in April was rather low due mainly to very cold weather in the north which reduced demand. Production increased sharply in May and so did prices.

There is a small acreage grown in the fall in the south and scattered central areas. These acres are usually harvested from November through January, depending on weather conditions. This acreage, yield and production are included in the following spring totals. The usual harvest season starts in the south in April, progresses northward into the central areas during May, the northern areas in June and usually ends in the Panhandle in July.

First plantings were made in the southwest during late December. Cold weather in January set the crop back and replanting was necessary. A combination of wet and dry conditions hurt the crop in the northern areas, increasing abandonment and lowering yields.

Harvest was underway in April, increased rapidly into May and peaked in June. Watermelons continued to be harvested in July but volume was less than normal. The season was over in all areas by the end of July.

OTHER CROPS
1981-82

Cantaloups are grown in Florida primarily in the southwest and north central areas. Much of the production is sold through roadside stands and local markets. The peak harvest period is normally May and June. Harvest begins in the southwest and progresses northward seasonally. There are some cantaloups grown during the fall months in the southwest and the west central areas. Acreage continues at a relatively low level. However, this crop is not part of the regular program for vegetables and melons. Researchers continue to work toward developing new varieties that will be better adapted to Florida's soils and climate. There appears to be some promise that acreage may expand in the future.

Cauliflower is grown in the Zellwood, Hillsborough-Manatee and Everglades areas. Acreage declined from a year earlier. Supplies are available from December to April. At the present time statistics are not available for publication. Shipment information is recorded by the Market News Service. In the 1981-82 season there were 52 thousand cwt. shipped out of the state compared with 77 thousand cwt. shipped the previous season. This converts to 236 thousand 22-pound cartons.

Tropical vegetable production during the 1981-82 season increased from the previous year. Damage from the January 1982 freeze was less severe than a year earlier; and weather was generally mild for the remainder of the winter. Improved fertilization and spray programs during the growing season contributed to good yields. By far the majority of the acreage is grown in Dade County. Commercial production began in the early 60's. Tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Carribbean origin. The most common name for each crop followed by the scientific name is listed below. Other common terms for various vegetables are shown in parentheses. The crops consist primarily of boniato-Ipomeabatata (sweet potato); calabaza-Cucurbita (pumpkin);malanga-Xanthesoma caracu or Colocasia esculenta (dasheen, yautia); and yucca-Manihot esculenta (cassava, crantz, tapioca). The boniato, calabaza and malanga constitute the bulk of the production. The Dade County Agricultural Extension Service reported 11,500 acres of tropical vegetables planted in the 1981 calendar year. Peak production of malanga occurs in February through April. Efforts are underway to even out the supply throughout the year. Available land continues to be a limiting factor for all agricultural production in Dade County. New varieties of calabaza are being brought in from Columbia, South America to select those that do best in south Florida. Miami is an important point of consumption for the Florida production. Also, considerable amounts are consumed in the Tampa Bay area. The supplies shipped out of the state are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard and other greens are grown thoughout the state and centered around large population areas and in the muck soils of the Everglades and Zellwood areas. Good volume is available November through March. Shipments totaled 57 thousand cwt. during the 1981-82 season, 20 thousand cwt. less than a year earlier.

Okra is grown in many areas of the state during the warm season of the year. However, Dade County produces okra for local use as well as for shipments to other states. Peak production takes place in May and June with a good supply in October and November.

Green onions and leeks are produced in the north central area. Supplies are marketed primarily for local use at roadside stands and markets. There are several large producers who ship to other states. Supplies of dry onions are limited. Most of the dry onions are produced in southern and wast central areas of the state.

Parsley is available in both the curley and plain types. The bulk of the commercial volume shipped to other states is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from the Sarasota, Lake Placid and other areas.

Southern peas are grown primarily in the northwest, west central and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are available from September through December. Heavy movement occurs in May and June, especially in northwest Florida. A high percentage of the crop is utilized for processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics for out-of-state markets show 19 thousand cwt. for fresh market during the 1981-82 season.

Watercress is available the year around. The major source of supply is the Oviedo area. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local state farmers markets, especially in the Sanford area.

VEGETABLES, MELONS, POTATOES AND STRAWBERRIES: ACREAGE, YIELD, PRODUCTION AND VALUE, FLORIDA, CROP YEARS 1980-81 AND 1981-82

CROP	PLANTED ACREAGE		HARVESTED ACREAGE		YIELD PER ACRE

NOTE: Pompano interstate shipments of Mexican produce imported through Arizona and Texas points. 1981-82 crop year, 1,000 package units: Cucumbers, bushels 519; Eggplant, cartons 10; Okra, crates 32; Peppers, cartons 19; Squash, bushels 6. This data has not been previously reported in the above tables. There was an additional amount of West Mexico produce brought into Florida for sale within the state, especially cucumbers and tomatoes for Jacksonville, Plant City and Tampa repackers.

Vegetable and melon imports: Imports of vegetables and melons via Florida ports by country of origin, by weeks and months, crop year 1981-82

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's poultry industry. It is intended for the use of poultrymen, allied industries and all others who are interested in poultry producion.

Many producers, hatcherymen, marketing agencies and others voluntarily supplied information used to develop these statistics. Their cooperation is sincerely appreciated.

This summary is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Bureau of Market News, Division of Marketing and the Poultry and Egg Section, Division of Inspection. Production and inventory data are official State and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

Published June 1983

POULTRY AND EGG SUMMARY

CASH RECEIPTS

Florida cash receipts from broilers, eggs and other poultry products in 1982 totaled $224.7 million, down 5 percent from the 1981 total of $236.5 million. 1982 receipts from eggs totaled $122.3 million, down 8 percent while broiler sales totaled $99.7 million, down fractionally. Other poultry product sales during 1982 totaled $2.8 million, down 25 percent from 1981.

The increase in broiler production was not sufficient to offset the 2 cents per pound annual average price decrease. Both egg production and annual average price recorded decreases. The 1982 annual average price of 49.6 cents per dozen was 3 cents lower than the 1981 egg price.

INVENTORY

Broiler production increased to another record 97,246,000 birds during 1982, 5 percent above 1981. The average number of layers during 1982 totaled 12,013,000, 4 percent below 1981.

PRODUCTION

Florida broiler production in 1982 totaled a record 398,709,000 pounds, 8 percent above 1981. Egg production totaled 2,963,000,000, down 3 percent from 1981. Eggs per layer averaged 247 during 1982, a 4 egg per layer increase.

During 1982, commercial hatcheries produced 150.6 million straight run chicks. Broiler-type chicks accounted for 77 percent of the total and egg-type chicks 23 percent.

TERMS AND DEFINITIONS

MARKETING YEAR--Poultry production, price and value statistics since 1970, are for the marketing year beginning December 1 through November 30. All statistics prior to 1970 are on a calendar year basis. For comparability, in those tables where monthly data are shown, December entries always refer to the preceding year. All hatch and hatchery placement data are reported on a calendar year basis.

BROILERS are meat-type chickens raised commercially and usually marketed in 7 - 8 weeks.

EGGS include both table and hatching eggs. Table egg prices are calculated on a farm basis, cases exchanged. They include all grades and sizes, but exclude charges for hauling, grading or packaging. Prices for hatching eggs are not published separately. Annual egg production, price and value statistics are for table and hatching eggs combined.

OTHER POULTRY cash receipts include chickens other than broilers, turkeys and miscellaneous farm poultry products.

CASH RECEIPTS are the returns received by farmers for all sales.

GROSS INCOME includes cash receipts plus the value of home consumption.

CURRENT YEAR data are preliminary and subject to revision.

SURVEY METHODOLOGY--Estimates of hens and pullets of laying age, pullets not yet of laying age, and of egg production are based upon data obtained from a sample of commercial chicken and egg producers. This sample is selected from the universe of Florida poultry management units, and includes approximately 80 percent of the total commercial laying flock. Estimates are expected to be within five percent of the value obtained if a complete enumeration were undertaken each month.

During December of each year all known commercial egg producers in Florida are contacted. This complete enumeration establishes the annual universe of management units. Management units include all independent producers as well as contractors who report for all contractees.

DOYLE CONNER
COMMISSIONER

Dear Friend:

Accurate information is the key for sound decisions. The livestock statistical data in this publication helps meet the information needs for individual production and marketing decisions and industry policies. It also helps assure the consumer of adequate supplies of food at reasonable prices.

Florida's livestock industry continues as a very important component of our agricultural sector. Cash receipts from marketing again totaled over one billion dollars in 1982, as it also did in 1981. Florida ranks first among states east of the Mississippi River in beef cows, ninth among all states. During 1982, Florida cattlemen east and south of the Suwannee River shipped 505,913 calves to 32 states.

I thank all of the voluntary reporters who supplied the basic data for this publication which was compiled through the cooperation of the Florida Department of Agriculture and Consumer Services and the U. S. Department of Agriculture.

Sincerely,

Doyle Conner

ACKNOWLEDGMENT

Many livestock producers and ranchers, slaughterers, auctions, feed lots, and other agencies associated with the livestock industry offered suggestions or voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The inventory, production, slaughter, utilization, monthly and annual average price, and livestock value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other livestock producing States are from official reports of the USDA Statistical Reporting Service. Information on shipments, auction market prices, and special feeder sales are from cooperative work between the Florida Department of Agriculture and Consumer Services, Livestock Market News Section and the Divisions of Inspection and Animal Industry and the USDA's Market News Branch, Agricultural Marketing Service.

LIVESTOCK SUMMARY

CATTLE AND CALVES

Florida's January 1, 1983 inventory of all cattle and calves, including both beef and dairy animals, totaled 2,425,000 head, a 3 percent increase over last year. Nationally, the cattle and calf inventory showed a less than one-half percent decrease from 1982.

Florida's beef cow herd increased by 1 percent to a total of 1,230,000 on January 1, 1983. Beef replacement heifers also showed a 1 percent increase over last year. Total calves on hand on January 1, 1983 at 527,000 head represents a 13 percent increase over 1982.

All cattle and calves shipped out of Florida by truck from areas east and south of the Suwannee River during 1982 totaled nearly 580,000 head, compared to nearly 621,000 in 1981. Stocker calves shipped out totaled nearly 506,000 head, 10 percent fewer than 1981.

Cattle in feedlots in Florida on January 1, 1983 totaled 90,000 head, the same level as 1982. The January 1 level is the only estimate of cattle on feed published for Florida.

Based on January 1, 1983 inventory numbers, Florida ranked 9th in beef cows, 16th in total cattle and calves, and 17th in milk cows. Florida continued to be number one in beef cows among states east of the Mississippi River.

CASH RECEIPTS

Cash receipts from Florida's cattle and calves marketed during 1982 totaled $310,907,000, a decrease of 16 percent from 1981. Total pounds marketed were 11 percent below 1981 and both cattle and calf prices averaged $2.00 per cwt. less than the previous year.

Receipts from hog marketings totaled $47,624,000, down 15 percent from 1981. Average price of $51.20 per cwt. was $7.60 per cwt. more than the 1981 average but pounds marketed fell by 18 percent.

HOGS ON FARMS

The December 1, 1982 Florida inventory of hogs and pigs is estimated at 290,000 head, up 13 percent from a year earlier. The breeding hog inventory was up 23 percent while the market hog inventory showed a 10 percent increase from a year ago.

Nationally, the December 1 inventory recorded a 9 percent decrease from 1981 and 17 percent less than 1980.

BEES AND HONEY

Due to budget cuts, the bee and honey estimating program was dropped. Only historical data are included in this summary.

SHEEP AND LAMBS

Florida estimates for sheep and lambs were discontinued after January 1978.

SURVEY METHODOLOGY

Primary data used in making cattle inventory estimates in this summary were obtained from probability surveys. Nationally, these surveys include approximately 70,000 farming operations heavily weighted to include operations having cattle. Information is collected by mail, telephone and personal interviews. Since all operations with cattle are not included in the sample, survey estimates are subject to sampling variability. This variability, as measured by the relative standard error, is about one percent at the national level for cattle inventory. This means that chances are approximately 95 out of 100 that a survey estimate will be within two percent of the complete coverage value if the same procedures were used to survey all producers. In Florida, approximately 1,400 cattle producers were surveyed with most of the large farms and ranches included in the count. As would be expected, the relative standard error for Florida and other states is greater than at the national level because of the smaller number of farms in the state samples.

Survey estimates are also subject to non-sampling errors such as omissions, duplications, recording and processing the data and mistakes in reporting. These errors cannot be measured directly, but they are minimized through rigid quality controls on the data collection process and a careful review of all reported data.

In setting the inventory estimates, survey information on births and deaths is used as well as inventory numbers. The survey results are combined with reliable data from other sources on slaughter, imports and exports to construct national and state balance sheets, which provide an additional check on survey inventory estimates.

ACKNOWLEDGMENT

The publication of this bulletin was made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service expresses its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under USDA programs. Others contributing information were the Florida Department of Agriculture, the Agricultural Experiment Station and Cooperative Extension Service, University of Florida.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Statistical Reporting Service, USDA, Florida Department of Agriculture; and Agricultural Experiment Station, University of Florida. Acreage, production, and value data are official statistics assembled under the direction of Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service.

INTRODUCTION AND SUMMARY OF THE 1982 FIELD CROPS SEASON

INTRODUCTION

This publication, released annually, contains statewide estimates of acreage, yield, production and value of production for all major field crops grown in Florida. The period covered for these crops is from 1972 through 1982. County data for the important producing counties which grow corn, soybeans, sugarcane, peanuts, tobacco, and cotton are published for the years 1981 and 1982. The complete series of crop estimates dating back to 1919 for the State are available upon request.

Crop estimates are designed to aid Florida farmers, bankers, credit organizations, transportation officials, research workers and others in agriculture, keep abreast of changes and appraise the current and future needs in the light of past experiences. These estimates represent a part of the Department's continuing program to provide comprehensive data for the various segments of agriculture.

SUMMARY 1982 SEASON

During January, temperatures averaged below normal. There was a hard freeze in the north on January 9 and 10 and in the central and south on January 11 and 12. The freeze caused considerable damage to the State's citrus, and to south Florida's vegetable and sugarcane crops. Temperatures were normal or near normal the rest of the year. Rainfall was generally ample during the winter months but dry conditions developed during the spring. Irrigation was active, where available, during this period. Rainfall during the summer months was about normal but the fall months were wetter than usual. Harvest of early planted crops was underway by early summer. Crop harvest made good progress during the summer and fall months. However, heavy rains in January and February slowed the sugarcane harvest, resulting in the longest harvest season on record for this crop. The 1982 crops had fair to good yields, which were better for most crops than the year before. Prices received for many crops, however, were lower than the 1981 prices.

The total area planted to corn in 1982 was 311,000 acres, 31 percent less than was planted in 1981. Of the total acres planted, 245,000 were harvested for grain, 25 percent less than the year before. The average yield was 62 bushels per acre, up 7 bushels from the year before and 2 bushels more than the previous record set in 1976. The average price received per bushel was $2.45, the lowest price since 1978. The value of corn produced for grain was placed at $37,216,000, down 27 percent from the year before.

The total area planted to soybeans in 1982 was a record 615,000 acres, up 29 percent from 1981. More acres of soybeans were planted in the State than any other field crop. There were 578,000 acres of soybeans harvested, up nearly 26 percent from the year before. The average yield was 27 bushels per acre, 3 bushels more than 1981. The average price of $5.45 per bushel was 75 cents less than the previous year and $2.45 less than two years ago. The value of the soybean crop was placed at $85,053,000, well above the $68,448,000 for the 1981 crop but still below the record value set in 1979. Soybeans remain in second place (next to sugarcane) as the State's most valuable field crop.

The total area of sugarcane harvested for both sugar and seed was estimated at 373,000 acres, 7 percent more than the previous season. Of this total, 358,900 acres were harvested for sugar and 14,100 acres were cut and used for seed. The average yield was 33.8 tons of cane per acre, 5 tons above the season before. Florida was the leading State in the production of raw sugar, producing 1,307,000 tons. The sugarcane harvest was off to a good start but unusually heavy rains during January and February stopped harvest completely and caused periodic mill shutdowns. This resulted in the longest harvest season on record–171 days. The value of the 1982 sugarcane crop will not be available until a later date. The value of the 1981 crop, sugarcane and seed combined, was placed at $286,543,000, well below the 1979 and 1980 crop values. From the 1982 sugarcane crop there was 81,028,000 gallons of blackstrap molasses –80° Brix, up nearly 3 percent from the previous season.

Hay production in the State during 1982 totaled 569,000 tons, up 18 percent from 1981 and 3 percent above 1980. Hay, including all kinds, was harvested from 237,000 acres, 3 percent more than 1981. The average yield was 2.4 tons per acre, an increase of .3 tons from the year before. Farmers selling hay received $75.00 per ton, up $3.50 from the 1981 price. The total value of all hay produced was $42,675,000, up 24 percent from the previous year.

There were 59,000 acres of peanuts planted in the State in 1982, down 14 percent from the year before. Of the total planted, 51,000 acres were harvested for dry peanuts. The remaining 8,000 acres were used for all other purposes but primarily for boiling. The average yield in 1982 was 3,000 pounds per acre, up 30 pounds from the 1981 average. The season average price per pound of peanuts in 1982 was 24 cents, down 3.3 cents from a year earlier. The value of dry peanuts sold was $36,720,000, down 25 percent from the year before.

Production of flue cured tobacco totaled 20,972,000 pounds, down 8 percent from the 22,848,000 pounds produced in 1981. There were 9,300 acres harvested, 300 acres less than a year ago. The average yield was 2,255 pounds per acre, 125 pounds less than 1981. The value of the State's tobacco crop was placed at $37,330,000, 2 percent less than the previous year. The average price received for all grades sold was $1.78 per pound, up 10.8 cents per pound from 1981.

The total area planted to cotton in 1982 was 16,000 acres, down 11 percent from the year before. Of this total, 15,000 acres were harvested. The average yield in 1982 was 627 pounds of lint cotton per acre, 26 pounds more than a year earlier and a record high yield for the State. Total production in 480 pound net-weight bales was 19,600 bales, 8 percent less than 1981. The average price received per pound of lint cotton was 56.2 cents, up very slightly from the year before. The value of the 1982 cotton crop was placed at $5,287,000 compared to $5,705,000 in 1981.

Utilized production from the 1982 crop of all pecans in Florida totaled 4,500,000 pounds, 10 percent less than the 1981 crop and 25 percent less than 1980. Of the total pounds utilized, 2,000,000 pounds were improved varieties and 2,500,000 pounds were native or seedling varieties. The average price for all pecans was 55.4 cents per pound. The improved varieties brought 61.0 cents per pound, 6.0 cents less than last year. The native or seedling types averaged 51.0 cents per pound, 6.0 cents more than 1981. The value of the pecan crop was placed at $2,495,000, 7 percent less than the previous year and 37 percent less than the 1980 crop.

Potato production in Florida in 1982, including both winter and spring, totaled 6.7 million cwt., up nearly 3 percent from the 1981 crop. A total of 30,800 acres were planted in 1982, about 1 percent more than the year before. Of the total acreage planted, 29,900 acres were harvested, the same as 1981. The value of the crop was placed at $60.4 million, down 17 percent from the previous year. The decline in the value of the crop was due to a sharp drop in the average price received. The price received for all potatoes averaged $8.95 per cwt. compared to $11.10 in 1981.

The average yield was 226 cwt. per acre, a new record for Florida, exceeding the previous record by 6 cwt. In the three county Hastings area (Flagler, Putnam and St. Johns) the average yield was 240 cwt., down slightly from 1981. Spring potatoes grown in other areas of the State had an average yield of 210 cwt., down 30 cwt. from the year before. However, the average yield for the winter crop was 185 cwt., up sharply from the previous winter of 155 cwt. and was responsible for pushing the all potato yield to the record level.

In south Florida where the winter crop is grown the red skin types are the dominant variety. Most of the winter production is sold for table stock. In the Hastings area the white skin varieties are the most important. Most of this production is used in the potato chip industry. However, potatoes used for table stock are increasing in importance.

Harvest of the winter crop got underway in late January and progressed slowly through most of March. Winter harvest was very active in late March and all of April. Digging of the spring crop was underway in late April and was very active during May. Harvest was completed in June. Acreage abandonment was about normal, caused mostly from flooding of low areas and freezing temperatures in January.

"WHY CROP AND LIVESTOCK REPORTS"

A man's judgment is no better than his facts and crop and livestock reports are the basic facts of Agriculture.

They aid farmers in planning their production and marketing and provide them with an orderly market.

They are the basis for analysis of agriculture and other business conditions.

They enable railroads to make better distribution of cars for moving farm products.

They give producers the same foresight to future price trends that organized dealers possess.

They are a check on fluctuation in price by removing uncertainty of supply.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools and others in planning constructive programs.

They give information on surplus and deficit areas of production making possible a more economical distribution of products.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce uncertainty which limits speculation in farm products. Speculation adds to the cost of marketing.

They indicate potential buying power enabling manufacturers to meet the probable demand.

They provide an accurate, reliable, unbiased picture of Florida's agriculture and furnish a sound basis for judgment and action by farmers, other individuals, business men, transportation agencies, crop and livestock interests, and governmental agencies.

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's dairy industry. It is intended for the use of dairymen, allied industries, and all others who are interested in dairy statistics.

Many dairy producers, marketing agencies, Federal Order Market Administrators, and others voluntarily supplied basic data used to develop these statistics. Their cooperation is sincerely appreciated.

This report is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Bureau of Dairy Farm Inspection, Division of Dairy Industry. Shipment data are from the Road Guard Bureau, Division of Inspection and Bureau of Dairy Laboratories, Division of Dairy Industry. Production and inventory data are official State and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

DAIRY SUMMARY

On January 1, 1983, cows kept for milk production on Florida farms and commercial dairies numbered 190,000 head, the same as last year. Milk cow replacement heifers, 500 pounds and over, on hand January 1, 1983, totaled 45,000 head. The combined total of milk cows and replacement heifers, 500 pounds and over, was 235,000 head, the same as January 1, 1982.

Florida dairies produced a record 2,109 million pounds of milk in 1982. Production was 1 percent above the previous year. Record production per cow averaged 11,100 pounds in 1982 which was 84 pounds more than the 1981 previous record average.

Cash receipts from marketings of Florida milk in 1982 totaled $343,416,000, a decrease of 1 percent from 1981. Milk marketed by producers averaged $16.40 per hundredweight in 1982 compared to $16.80 in 1981.

The United States dairy herd size continued the increase which began in 1980. The 1982 annual average totaled 11,026,000 milk cows, 1 percent above the 1981 annual average. Milk replacement heifers on farms January 1, 1983 numbered 4,532,000 head, unchanged from the previous year.

Total milk production was a record 135.8 billion pounds in 1982, 2 percent above the 1981 output. Milk production per cow averaged 12,316 pounds, another record and 139 pounds more than 1981.

Farmers' cash receipts from marketings of milk in 1982 were a record high $18,274 million for the Nation, 1 percent more than the previous record of $18,128 million in 1981.
